## Being “led” all the way

No, nothing deeply philosophical, this is a reference to the LED (light-emitting diode) light fixtures that E C Electricals have now installed. The many benefits of LED are well known. Low energy consumption and longer service life make it a sound proposition. Pictured right -the four large, pendant, inverted, tulip shaped lights in the worship hall. Elsewhere, on the ground floor the illumination is provided by a number of flush fitting ceiling lights throughout the foyer and beneath the mezzanine level.

Another camera viewpoint has vanished! Last week it was time for the pair of containers that have served us so well, to leave us and free up space. The upper unit was the site office, where Marc Spencely ran all the day to day business and so ably kept us on schedule. He now runs operations from a desk inside the hall. The lower cabin doubled as the tea and coffee break refuge and dry, secure storage for smaller materials and components. For me, the landing at the top of the stairs up to the top unit was the perfect photo station to capture many of the shots you have seen.

Mark and Steve, from M & M Groundworks up at Somerton, have really weaved their magic at the main entrance. Two weeks ago, the area looked like the Somme and now it's a really neat and tidy set of steps, non-slip paving slabs, plus a wheelchair friendly ramp. Faced with awkwardly placed drainage ports at different levels, watching them was an education in earth sculpture. The next bulletin will highlight their equally amazing handiwork at the back of the building for the heat source pump base.
